CONTENTS

ADJUSTMENT TO THE USDA

The purpose of this brief is to explore what adjustments to the USDA measurements of child-rearing expenditures for updating the child support table may be appropriate and the impact of those adjustments.   In particular, CPR understands that the task force is interested in "second household adjustments."[1]

CPR identified three adjustments from the USDA-updated table provided in the July briefing that may be appropriate.

- Exclude all the unreimbursed, out-of-pocket medical expenses for the child from the table.

- Recognize that that there is likely to be a change in the obligated parent's tax filing status that reduces the obligated parent's after-tax income available to pay child support. That is, the obligated parent's tax filing status may have been married prior to the establishment of the support order.

- Use different "equivalence scales" to progress table amounts for the number of children. For example, the USDA essentially implies that two children cost 57.5 percent more than one child to raise. (There is not a doubling of expenditures from one to two children because of some economies of scale.)

CPR also explored the possibility of second household adjustment based on the housing cost differential between children living in a single-parent family household and an intact family household, but dropped it because it had a negligible impact.

More detail about each of these adjustments is provided below. Side-by-side comparisons are attached. The comparisons layer on the adjustments. B.1 is the first adjustment (exclusion of all out-of-pocket medical expenses). B.2 excludes all out-of-pocket medical expenses *and* makes the tax adjustment. B.3 includes all three adjustments.

DETAILED EXPLANATIONS OF ADJUSTMENTS

This section provides more detail about the adjustments.

EXCLUDE ALL THE UNREIMBURSED MEDICAL EXPENSES FOR THE CHILD FROM THE TABLE

The July-developed table included $250 per child per year for ordinary medical expenses. This is the norm in most income shares states. CPR could not locate documentation that indicated at Minnesota includes any ordinary medical expenses in the table; and, the written provisions in the guidelines suggest that there are none in the table. The provision is that each parent is responsible for his or her prorated share of the child's out-of-pocket medical expenses.

---

[1] A term used in Mark Rogers presentation to the Task Force.

The rationale among states including it is that all children are likely to incur some medical expenses. Inclusion of an average amount reduces the need for the parents to exchange medical receipts and arrangement for the payment of those out-of-pocket medical expenses. If a state includes $250 per child per year and the custodial parent is incurring the expense, the custodial parent would seek reimbursement from the obligated parent for his/her prorated share of anything spent above $250 per child. The amount $250 approximated average out-of-pocket expenses before the Affordable Care Act (ACA). Post ACA, the amount is considerably less amount children enrolled in Medicaid and considerably more among children with private coverage. To that end, if Minnesota were to include an amount for ordinary medical expenses it would be better handled as an add-on similar to child care expenses or the cost of the child's health insurance. Michigan does this and Ohio is proposing something similar.

ADJUSTING FOR LESS AFTER-TAX INCOME

The USDA provides measurements of child-rearing expenditure for married couples for three gross income ranges. CPR translated those gross incomes to an after-tax income using federal and state tax rates for a married couple claiming the number of children for whom support is being determined as tax dependents. Once CPR calculated these after-tax income amounts, CPR found the equivalent gross income of a single taxpayer claiming no dependents. These produced higher incomes. In turn, CPR applied these simulated higher incomes to the produce an updated table. It essentially reduces the table amounts.

EQUIVALENCE SCALES FOR NUMBER OF CHILDREN

The USDA study shows the amounts for one child in a two-child household. It suggests multiplying that amount by 1.27 if there is only one child in the household. For three and more children, it suggests multiplying that amount by the number of children multiplied by 0.76. In other words, under the USDA, expenditures for two children are 157.50% more than they are for one child, and expenditures on three children are 114 percent more than they are for two children. In contrast, the Betson-Rothbarth measurements for one child is about 140 percent. The BR equivalence form the basis of the National Academy of Science equivalence scale that is used to adjust for family size in international comparisons of economic well-being.
